

Minimally invasive surgery, which includes both laparoscopic and robot-assisted surgical procedures, uses tiny instruments, intentionally designed to make fewer, smaller incisions. As the latest state-of-the-art robotic technology, the da Vinci Xi allows our surgeons to have a greater range of motion, sharper visibility and the ability to operate with impeccable precision.

Through investing in this advanced technology, we're able to keep our commitment to consistently give the North Country the best possible care—right here at home.

# ROBOTIC HERNIA REPAIR

**The da Vinci Xi®. Faster  
Recovery. Smaller Incisions. Less  
Pain—The Future Has Arrived.**

The da Vinci Xi® is state-of-the-art robotic surgery technology. As a miniature 3-D camera illuminates the path ahead, our team of highly skilled, robotics-trained surgeons perform delicate surgery. Guiding tiny instruments that are intentionally designed to make fewer, smaller incisions—barely millimeters in length—our surgeons can perform meticulously precise procedures, getting you home faster—and more comfortably.

While the da Vinci Xi® represents the latest advancement in surgical and robotic technology, it can't perform surgery on its own. It needs experience and surgical instinct to guide it. What does that mean for you? The sharpest minds in the North Country are behind the most advanced surgical tool—protecting you every step of the way.

Additional benefits of minimally invasive surgery include:

- Less scarring, pain and blood loss
- Faster recovery
- Smaller, fewer incisions
- Shorter hospital stays
- Limited lifting restrictions post-surgery
- In many cases, better clinical outcomes

**Nearly 5 million people in the U.S. develop hernias every year.** While both children and adults suffer from hernias, men are eight times more likely to develop inguinal hernias than women. Now, with minimally invasive surgical technology, we can solve this common problem faster and with greater precision—leaving you with less pain and discomfort, smaller incisions, and a quicker recovery. While some patients require an overnight stay, most are discharged the same day as surgery and can resume their normal activity in one week.
